

**ATTORNEY DOCKET NO. 093615600017****ABSTRACT**

This application is directed to systems and methods for managing wireless network sensors. A plurality of wireless network sensors in the network region are identified. For each of the network sensors in the plurality of wireless network sensors, a designation of primary or secondary with respect to the network region is selected. A collection agent for the selected network region is determined. An indicator of the determined collection agent is communicated to the plurality of wireless network sensors in the network region. Scan data for the network region is received from the collection agent.
